# Analysis of the security of the PSSI problem and applications and optimizations to Durandal signature scheme 

Nicolas Aragon, Maxime Bros, Victor Dyseryn, Philippe Gaborit

XLIM, Université de Limoges, France
GT Codes-Crypto - November 21, 2022

## Durandal signature scheme

- Rank-based signature presented at EUROCRYPT'19 [ABG $\left.{ }^{+} 19\right]$
- Adaptation of Schnorr-Lyubashevsky proof of knowledge, with variations to avoid attacks
- Fiat-Shamir heuristic to transform into a signature scheme
- No equivalent found for Hamming metric
- Based on problems : RSL, IRSD, PSSI

|  | pk size | $\sigma$ size |
| :---: | :---: | :---: |
| Durandal-I | 15.2 KB | 4.1 KB |
| Durandal-II | 18.6 KB | 5.0 KB |

## What has happened with Durandal since 2019?

- Resistant to attacks since 2019
- Better understanding of the RSL problem (algebraic attack in 2021 [BB21], combinatorial attack in 2022 [BBBG22])
- PSSI reduction to MinRank (ongoing work)
- New combinatorial attack on PSSI (ongoing work, breaks existing parameters in $\approx 2^{36}$ attempts)
- Optimizations and size-performance tradeoffs

## What has happened with Durandal since 2019 ?

- Resistant to attacks since 2019

## Summary

(1) PSSI problem
(2) A first observation
(3) An attack against PSSI

4 Mitigation and new parameters
(5) Optimizations on Durandal
(6) Conclusion and perspectives

## Summary

(1) PSSI problem
(2) A first observation
(3) An attack against PSSI

4 Mitigation and new parameters
(5) Optimizations on Durandal
(6) Conclusion and perspectives

## Notation

- $\operatorname{Gr}\left(d, \mathbb{F}_{q^{m}}\right)$ is the set of subspaces of $\mathbb{F}_{q^{m}}$ of $\mathbb{F}_{q^{-}}$-dimension $d$.
- $x \stackrel{\$}{\leftarrow} X$ means that $x$ is chosen uniformly at random in $X$
- For $E, F$ subspaces of $\mathbb{F}_{q^{m}}$, the product space $E F$ is defined as :

$$
E F:=\operatorname{Vect}_{\mathbb{F}_{q}}\{e f \mid e \in E, f \in F\}
$$

If $\left(e_{1}, \ldots, e_{r}\right)$ and $\left(f_{1}, \ldots, f_{d}\right)$ are basis of $E$ and $F$, then $\left(e_{i} f_{j}\right)_{1 \leq i \leq r, 1 \leq j \leq d}$ contains a basis of $E F$.

## PSSI problem

## Definition (PSS sample)

Let $E \subset \mathbb{F}_{q^{m}}$ a subspace of $\mathbb{F}_{q^{-}}$-dimension $r$. A Product Space Subspace (PSS) sample is a couple of subspaces ( $F, Z$ ) defined as follows:

- $F \stackrel{\$}{\leftarrow} \operatorname{Gr}\left(d, \mathbb{F}_{q^{m}}\right)$
- $U \stackrel{\$}{\leftrightarrows} \mathbf{G r}(r d-\lambda, E F)$ such that $\{e f \mid e \in E, f \in F\} \cap U=\{0\}$
- $W \stackrel{\$}{\leftarrow} \mathbf{G r}\left(w, \mathbb{F}_{q^{m}}\right)$
- $Z=W+U$

## PSSI problem

## Definition (Random sample)

A random sample is a couple of subspaces $(F, Z)$ with :

- $F \stackrel{\$}{\leftarrow} \mathbf{G r}\left(d, \mathbb{F}_{q^{m}}\right)$
- $Z \stackrel{\$}{\leftarrow} \mathbf{G r}\left(w+r d-\lambda, \mathbb{F}_{q^{m}}\right)$
- $F$ and $Z$ are independent

## PSSI problem

## Definition (PSSI problem, from Durandal [ABG+19])

The Product Spaces Subspaces Indistinguishability (PSSI) problem consists in deciding whether $N$ samples ( $F_{i}, Z_{i}$ ) are PSS samples or random samples.

## Definition (Search-PSSI problem)

Given $N$ PSS samples $\left(F_{i}, Z_{i}\right)$, the search-PSSI problem consists in finding the vector space $E$ of dimension $r$.

## What happens if $\lambda=0$ ?

There is no filtration : $(F, Z)=(F, W+E F)$. Take $\left(f_{1}, \ldots, f_{d}\right)$ a basis of $F$.

To find $E$ in one sample, compute :

$$
A=\bigcap_{i=1}^{d} f_{i}^{-1} Z
$$

Similar arguments than LRPC decoding :

$$
\begin{aligned}
f_{i}^{-1} Z & =f_{i}^{-1} f_{1} E+\ldots+E+\ldots+f_{i}^{-1} f_{d} E+f_{i}^{-1} W \\
& =E+R_{i}
\end{aligned}
$$

## Practical parameters for PSSI

| $m$ | $w$ | $r$ | $d$ | $\lambda$ |
| :---: | :---: | :---: | :---: | :---: |
| 241 | 57 | 6 | 6 | 12 |

## Existing attack for PSSI

Choose $A \subset F$ a subspace of dimension 2 and check whether

$$
\operatorname{dim}(A Z)<2(w+r d-\lambda)
$$

## Proposition ([ABG $\left.{ }^{+} 19\right]$ )

The advantage of the distinguisher is of the order of $q^{(r d-\lambda)-m}$.

## Existing attack for PSSI

Choose $A \subset F$ a subspace of dimension 2 and check whether

$$
\operatorname{dim}(A Z)<2(w+r d-\lambda)
$$

## Proposition ([ABG $\left.{ }^{+} 19\right]$ )

The advantage of the distinguisher is of the order of $q^{(r d-\lambda)-m}$.
Several problems :

- The distinguisher only uses one signature;
- It does not depend on $w$;
- It does not allow to recover the secret space $E$.

## Summary

## (1) PSSI problem

(2) A first observation
(3) An attack against PSSI

4 Mitigation and new parameters
(5) Optimizations on Durandal
6) Conclusion and perspectives

## Combining two instances

## A partial explanation

## Impossibility to avoid 2-sums

 (for $\lambda=2 r=2 d$ )
## Protection by $m$

Recall that

- $\operatorname{dim} F=d$
- $\operatorname{dim} Z=w+r d-\lambda$
so

$$
\operatorname{dim} F_{1} Z_{2}+F_{2} Z_{1}=2 d(w+r d-\lambda)>m
$$

but we can take subspaces of $F_{1}$ and $F_{2}$ to remain below $m$ !

| $m$ | $w$ | $r$ | $d$ | $\lambda$ | $w+r d-\lambda$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 241 | 57 | 6 | 6 | 12 | 81 |

## Summary

## (1) PSSI problem

(2) A first observation

3 An attack against PSSI

4 Mitigation and new parameters
(5) Optimizations on Durandal
6) Conclusion and perspectives

## Refining the first observation

## Probability

## Heuristic

Let $\left(e_{1}, e_{2}\right) \stackrel{\$}{\leftarrow} E$ and $U \subset E F$ filtered of dimension $r d-\lambda$. Suppose $\lambda=2 d$, then

$$
\mathbb{P}\left(\exists\left(f_{1}, f_{2}\right) \in F \mid e_{1} f_{1}+e_{2} f_{2} \in U\right) \geq 1-\frac{1}{e}
$$

## Heuristic

Let $\left(f_{1}, f_{2}\right) \stackrel{\$}{\leftarrow} F$ and $U \subset E F$ filtered of dimension $r d-\lambda$. Suppose $\lambda=2 r$, then

$$
\mathbb{P}\left(\exists\left(e_{1}, e_{2}\right) \in E \mid e_{1} f_{1}+e_{2} f_{2} \in U\right) \geq 1-\frac{1}{e}
$$

## An attack with three signatures

## Recovering elements of $E$

## Combining signatures two by two

## Does it really work?

We want the chain of intersections

$$
A:=\frac{f_{2}^{\prime} Z_{1}+f_{1}^{\prime} Z_{2}}{\left|\begin{array}{ll}
f_{1} & f_{1}^{\prime} \\
f_{2} & f_{2}^{\prime}
\end{array}\right|} \bigcap \frac{f_{3}^{\prime} Z_{1}+f_{1}^{\prime} Z_{3}}{\left|\begin{array}{ll}
f_{1} & f_{1}^{\prime} \\
f_{3} & f_{3}^{\prime}
\end{array}\right|} \bigcap \frac{f_{3}^{\prime} Z_{2}+f_{2}^{\prime} Z_{3}}{\left|\begin{array}{ll}
f_{2} & f_{2}^{\prime} \\
f_{3} & f_{3}^{\prime}
\end{array}\right|}
$$

to be equal to $\{0\}$, in general.

All the subspaces $f_{i} Z_{j}+f_{j} Z_{i}$ are of dimension $2(w+r d-\lambda)$.

| $m$ | $w$ | $r$ | $d$ | $\lambda$ | $2(w+r d-\lambda)$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 241 | 57 | 6 | 6 | 12 | 162 |

## Probabilities on the intersection of two vector spaces

## Heuristic

Let $A$ and $B$ be uniformly random and independent subspaces of $\mathbb{F}_{q^{m}}$ of dimension $a$ and $b$, respectively.

- If $a+b<m$, then $\mathbb{P}(\operatorname{dim}(A \cap B)>0) \approx q^{a+b-m}$;
- If $a+b \geq m$, then the most probable outcome is $\operatorname{dim}(A \cap B)=a+b-m$.

## Generalization to $n$ intersections

## Heuristic

For $1 \leq i \leq n$, let $A_{i} \stackrel{\$}{\leftarrow}$ Fqm be independent subspaces of fixed dimension $a$.

- If $n a<(n-1) m$, then $\mathbb{P}\left(\operatorname{dim}\left(\bigcap_{i=1}^{n} A_{i}\right)>0\right) \approx q^{n a-(n-1) m}$;
- If $n a \geq(n-1) m$, then the most probable outcome is $\operatorname{dim}\left(\bigcap_{i=1}^{n} A_{i}\right)=n a-(n-1) m ;$

In our setting :

- $a=162, m=241, n=3$
- $n a=486,(n-1) m=482$

Most probable outcome : $\operatorname{dim}(A)=4$
$\because$

## Let's refine again!

We consider four samples :

$$
\left(F_{1}, Z_{1}\right),\left(F_{2}, Z_{2}\right),\left(F_{3}, Z_{3}\right),\left(F_{4}, Z_{4}\right)
$$

and we draw matrices :

$$
\left(\begin{array}{ll}
f_{1} & f_{1}^{\prime} \\
f_{2} & f_{2}^{\prime} \\
f_{3} & f_{3}^{\prime} \\
f_{4} & f_{4}^{\prime}
\end{array}\right)
$$

with $\left(f_{1}, f_{1}^{\prime}\right)$ fixed.
Probability of success $\approx(1-1 / e)^{4} q^{-6 d} \approx 0.16 q^{-6 d}$
And now 6 vectors spaces to intersect!

## Summary

## (1) PSSI problem

(2) A first observation
(3) An attack against PSSI
(4) Mitigation and new parameters
(5) Optimizations on Durandal
(6) Conclusion and perspectives

## Probability of success of the attack

## $\approx 0.16 q^{-6 d}$

Increase $\lambda \Rightarrow$ Impossible due to inexistence of solution
Decrease $m \quad \Rightarrow \quad$ Impossible due to Singleton bound
Increase $d \Rightarrow$ Very large parameters... $(m \geq 400)$

Increase q!

## New parameters

|  | 9 | $m$ | k | $n$ | w | $r$ | d | $\lambda$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 2 | 241 | 101 | 202 | 57 | 6 | 6 | 12 |  |
| pk size |  | $\sigma$ size | MaxMinors [ $\mathrm{BBC}^{+} 20$ ] |  |  |  |  | Our attack |  |
| 15.2KB |  | 4.1KB | 98 |  |  |  |  |  | 56 |

$\downarrow$

|  | $q$ | $m$ | $k$ | $n$ | $w$ | $r$ | $d$ | $\lambda$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 4 | 173 | 85 | 170 | 5 | 8 | 9 | 18 |
| pk size | $\sigma$ size | MaxMinors $\left[\mathrm{BBC}^{+} 20\right]$ |  |  |  |  | Our attack |  |
| 14.7 KB | 5.1 KB | 232 |  |  |  | 128 |  |  |
|  |  |  |  |  | Keygen | Signature | Verification |  |
|  | 5 ms | 350 ms | 2 ms |  |  |  |  |  |

## Summary

## (1) PSSI problem

(2) A first observation
(3) An attack against PSSI

4 Mitigation and new parameters
(5) Optimizations on Durandal
(6) Conclusion and perspectives

## Two optimizations

(1) Fast matrix inversion for signing
© Size-performance tradeoff

## Spotting structure in a linear system

## Idea

Exploit a block structure in a big linear system of size $\lambda n \times \lambda n$.
Each block is of size $k \times k$ and can be inverted with Euclid's algorithm (with cost $O(k \log k)$ ).

We then use Strassen algorithm :

|  | Naive | Ours |
| :---: | :---: | :---: |
| Cost | $O\left((\lambda n)^{\omega}\right)$ | $O\left(\lambda^{\omega} n \log n\right)$ |

| Keygen | Signature | Verification |
| :---: | :---: | :---: |
| 5 ms | 350 ms <br> 40 ms | 2 ms |

## Size-performance tradeoff

A Durandal signature is composed of a tuple $(\boldsymbol{z}, \boldsymbol{c}, \boldsymbol{p})$. To verify, compute

$$
\boldsymbol{x}=\boldsymbol{H} \boldsymbol{z}^{\top}+\boldsymbol{S}^{\prime} \boldsymbol{c}^{\top}+\boldsymbol{S p}^{\top}
$$

## Idea

Send Supp(z) instead of $\boldsymbol{z}$.
...but we also need to send some coordinates of $\boldsymbol{x}$ !

## Impact on parameters

| $q$ | $m$ | $k$ | $n$ | $w$ | $r$ | $d$ | $\lambda$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 4 | 173 | 85 | 170 | 5 | 8 | 9 | 18 |

Shorter size version

| pk size | $\sigma$ size | Signing time | Verification time |
| :---: | :---: | :---: | :---: |
| 14.7 KB | 5.1 KB | 40 ms | 2 ms |
|  | 2.6 KB | 1 s | 1 s |

Faster verification version

| pk size | $\sigma$ size | Signing time | Verification time |
| :---: | :---: | :---: | :---: |
| 14.7 KB | 5.1 KB | 40 ms | 2 ms |
|  | 4.3 KB | $\mathbf{1 s}$ |  |

## Summary

## (1) PSSI problem

(2) A first observation
(3) An attack against PSSI

4 Mitigation and new parameters
(5) Optimizations on Durandal

6 Conclusion and perspectives

## Conclusion

- Analysis of a less studied problem at the core of a competitive signature scheme
- New secure parameters remain attractive
- Optimizations makes the scheme even more competitive

## Perspectives

- Refine the analysis on the security of PSSI problem
- Tweak to avoid the new attack on PSSI without penalizing the parameters

Thank you for your attention!

## Combining two instances

We simplify and assume $w=0$.
We take two instances $\left(F_{1}, Z_{1}\right),\left(F_{2}, Z_{2}\right)$.
We made the following observation :

- $Z_{1}$ is filtered in $E F_{1}$
- $Z_{2}$ is filtered in $E F_{2}$
- but...
- $F_{1} Z_{2}+F_{2} Z_{1}$ is not filtered in $E\left(F_{1} F_{2}\right)$ !

## A partial explanation

If there exists $\left(e_{1}, e_{2}\right) \in E^{2}$ such that

$$
\begin{aligned}
& e_{1} f_{1}+e_{2} f_{1}^{\prime}=z_{1} \in Z_{1} \\
& e_{1} f_{2}+e_{2} f_{2}^{\prime}=z_{2} \in Z_{2}
\end{aligned}
$$

then

$$
f_{1}^{\prime} z_{2}+f_{2}^{\prime} z_{1}=e_{1}\left(f_{1}^{\prime} f_{2}+f_{2}^{\prime} f_{1}\right)
$$

## Impossibility to avoid 2-sums

## Refining the first observation

By drawing randomly a matrix

$$
\left(\begin{array}{ll}
f_{1} & f_{1}^{\prime} \\
f_{2} & f_{2}^{\prime}
\end{array}\right) \quad\left(f_{1}, f_{1}^{\prime}\right) \stackrel{\$}{\leftarrow} F_{1},\left(f_{2}, f_{2}^{\prime}\right) \stackrel{\$}{\leftarrow} F_{2}
$$

we get (roughly) $q^{-4 d}$ chances of having a product element ef (with $e \in E, f \in F_{1} F_{2}$ ) :

$$
e f \in f_{1}^{\prime} Z_{2}+f_{2}^{\prime} Z_{1}
$$

## Refining the first observation

By drawing randomly a matrix

$$
\left(\begin{array}{ll}
f_{1} & f_{1}^{\prime} \\
f_{2} & f_{2}^{\prime}
\end{array}\right) \quad\left(f_{1}, f_{1}^{\prime}\right) \stackrel{\$}{\leftarrow} F_{1},\left(f_{2}, f_{2}^{\prime}\right) \stackrel{\$}{\leftarrow} F_{2}
$$

we get (roughly) $q^{-4 d}$ chances of having a product element ef (with $e \in E, f \in F_{1} F_{2}$ ) :

$$
e f \in f_{1}^{\prime} Z_{2}+f_{2}^{\prime} Z_{1}
$$

We need :

- A way to recover this element $e \in E$;
- A precise probability of recovering $e$

## The attack

We consider three samples :

$$
\begin{aligned}
& \left(F_{1}, Z_{1}\right) \\
& \left(F_{2}, Z_{2}\right) \\
& \left(F_{3}, Z_{3}\right)
\end{aligned}
$$

$$
(1-1 / e)^{3} \approx 0,25
$$

there exists elements such that

$$
\begin{align*}
& e_{1} f_{1}+e_{2} f_{1}^{\prime}=z_{1} \in Z_{1}  \tag{1}\\
& e_{1} f_{2}+e_{2} f_{2}^{\prime}=z_{2} \in Z_{2}  \tag{2}\\
& e_{1} f_{3}+e_{2} f_{3}^{\prime}=z_{3} \in Z_{3} \tag{3}
\end{align*}
$$

## Recovering elements of $E$

Suppose $\left(\begin{array}{ll}f_{1} & f_{1}^{\prime} \\ f_{2} & f_{2}^{\prime}\end{array}\right)$ invertible, we can recover $e_{1}$ and $e_{2}$ with

$$
e_{1}=\frac{\left|\begin{array}{ll}
z_{1} & f_{1}^{\prime} \\
z_{2} & f_{2}^{\prime}
\end{array}\right|}{\left|\begin{array}{ll}
f_{1} & f_{1}^{\prime} \\
f_{2} & f_{2}^{\prime}
\end{array}\right|} \in \frac{\left|\begin{array}{cc}
z_{1} & f_{1}^{\prime} \\
Z_{2} & f_{2}^{\prime}
\end{array}\right|}{\left|\begin{array}{ll}
f_{1} & f_{1}^{\prime} \\
f_{2} & f_{2}^{\prime}
\end{array}\right|}=\left|\begin{array}{ll}
f_{1} & f_{1}^{\prime} \\
f_{2} & f_{2}^{\prime}
\end{array}\right|^{-1}\left(f_{2}^{\prime} Z_{1}+f_{1}^{\prime} Z_{2}\right)
$$

Similarly,

$$
e_{2} \in\left|\begin{array}{ll}
f_{1} & f_{1}^{\prime} \\
f_{2} & f_{2}^{\prime}
\end{array}\right|^{-1}\left(f_{2} Z_{1}+f_{1} Z_{2}\right)
$$

## Combining signatures two by two

Compute

$$
A:=\frac{f_{2}^{\prime} Z_{1}+f_{1}^{\prime} Z_{2}}{\left|\begin{array}{ll}
f_{1} & f_{1}^{\prime} \\
f_{2} & f_{2}^{\prime}
\end{array}\right|} \bigcap \frac{f_{3}^{\prime} Z_{1}+f_{1}^{\prime} Z_{3}}{\left|\begin{array}{ll}
f_{1} & f_{1}^{\prime} \\
f_{3} & f_{3}^{\prime}
\end{array}\right|} \bigcap \frac{f_{3}^{\prime} Z_{2}+f_{2}^{\prime} Z_{3}}{\left|\begin{array}{ll}
f_{2} & f_{2}^{\prime} \\
f_{3} & f_{3}^{\prime}
\end{array}\right|}
$$

With great probability,

- If we are in the case of equations (1), (2) and (3) then $A=\operatorname{Vect}\left(e_{1}\right)$
- Else, $A=\{0\}$ and we retry with other random $\left(f_{2}, f_{2}^{\prime}, f_{3}, f_{3}^{\prime}\right)$.

Probability of success $\approx 0.25 q^{-4 d}$

## Signing process in Durandal

To produce a Durandal signature, we need to solve a system :

$$
z=c S^{\prime}+p S
$$

with

- $\boldsymbol{p} \in F^{4 k}$ unknown
- $\operatorname{Supp}(z) \subset U$ filtered subspace in $E F$ of codimension $\lambda$
- c depending on the message
- $\boldsymbol{S}$ and $\boldsymbol{S}^{\prime}$ the secret key

## Signing process in Durandal

It is shown to be equivalent to solving :

$$
\boldsymbol{M}\left(\begin{array}{c}
p_{11}  \tag{4}\\
\vdots \\
p_{i \ell} \\
\vdots \\
p_{l k d}
\end{array}\right)=\boldsymbol{b}
$$

where $\boldsymbol{M}$ is the binary matrix

$$
\begin{equation*}
\boldsymbol{M}=\left(\pi_{h}\left(f_{\ell} \boldsymbol{S}_{i j}\right)\right)_{11 \leq i \ell \leq l k d, 11 \leq h j \leq \lambda n} \tag{5}
\end{equation*}
$$

( $\pi_{h}$ is the projector on the last $\lambda$ coordinates of $E F$ )

## Naive inversion

$\boldsymbol{M}$ is a large $\lambda n \times \lambda n$ binary matrix.

$$
\text { Cost : } O\left((\lambda n)^{\omega}\right)
$$

## Spotting structure in $M$

$\boldsymbol{M}$ is composed of ideal blocks $\boldsymbol{M}_{\ell, h}=\pi_{h}\left(f_{\ell} \boldsymbol{S}\right)$
$\left(\begin{array}{c|ccc|c}\boldsymbol{M}_{1,1} & & & & \boldsymbol{M}_{1, \lambda} \\ \hline & & \ldots & & \\ & \ldots & & \\ & \boldsymbol{M}_{\ell, h} & \vdots & \\ & & \ldots & & \\ & & & & \\ \hline \boldsymbol{M}_{d, 1} & & & & \boldsymbol{M}_{d, \lambda}\end{array}\right)$

## Spotting structure in $M$

Each block is of size $k \times k$ and can be inverted with Euclid's algorithm (with cost $O(k \log k)$ ).

We then use Strassen algorithm :

|  | Naive | Ours |
| :---: | :---: | :---: |
| Cost | $O\left((\lambda n)^{\omega}\right)$ | $O\left(\lambda^{\omega} n \log n\right)$ |

| Keygen | Signature | Verification |
| :---: | :---: | :---: |
| 5 ms | 350 ms <br> 40 ms | 5 ms |

## Variant scheme

Sign

$$
\begin{aligned}
& \boldsymbol{y} \stackrel{\$}{\leftarrow}(W+E F)^{n} \\
& \boldsymbol{x}=\boldsymbol{y} \boldsymbol{H}^{\top}
\end{aligned}
$$

Verify

$$
\boldsymbol{x}=\boldsymbol{H} \boldsymbol{z}^{\top}+\boldsymbol{S}^{\prime} \boldsymbol{c}^{\top}+\boldsymbol{S} \boldsymbol{p}^{\top}
$$

## Variant scheme

Sign

$$
\begin{aligned}
& \boldsymbol{y} \stackrel{\$}{\leftarrow}(W+E F)^{n} \\
& \boldsymbol{x}=\boldsymbol{y} \boldsymbol{H}^{\top}
\end{aligned}
$$

Verify
$\boldsymbol{x}=\boldsymbol{H} \boldsymbol{z}^{\top}+\boldsymbol{S}^{\prime} \boldsymbol{c}^{\top}+\boldsymbol{S} \boldsymbol{p}^{\top}$

## Sign

$\hat{\boldsymbol{x}} \stackrel{\$ \mathbb{F}_{q^{m}}^{b}}{ }$
Solve $\hat{\boldsymbol{x}}=\boldsymbol{y} \hat{\boldsymbol{H}}^{\top}$ with
$\operatorname{Supp}(\boldsymbol{y})=W+E F$
$\boldsymbol{x}=\boldsymbol{y} \boldsymbol{H}^{\top}$

## Verify

Solve
$\hat{\boldsymbol{x}}=\hat{\boldsymbol{H}} \boldsymbol{z}^{\top}+\hat{\boldsymbol{S}}^{\prime} \boldsymbol{c}^{\top}+\hat{\boldsymbol{S}} \boldsymbol{p}^{\top}$ with Supp (z)

$$
\boldsymbol{x}=\boldsymbol{H} \boldsymbol{z}^{\top}+\boldsymbol{S}^{\prime} \boldsymbol{c}^{\top}+\boldsymbol{S p}^{\top}
$$
